There are over 15 billion passwords for sale by cybercriminals on the dark web.

81% of breaches leveraged stolen or weak passwords.

99.9% of account hacks could have been blocked by MFA.

Nearly 1/2 of people surveyed say they have never heard of MFA.

MFA means using your password plus a code sent to your email or phone, or a notification sent to an authenticator app on your phone, or a biometric like your fingerprint.

When you use MFA on your accounts, it means a cybercriminal can't access your account with just your password alone.
